

FIND THE MAIN TOPIC

Read the text. Underline the key details with four different colors. Then, place the main topic in the central oval. Now, write the key details about the topic in the remaining ovals.

Computers are machines that help us do many things. They have screens where we can see information. We use keyboards to type words and numbers. Computers can do math for us and help us learn new things.

Inside a computer, there are many tiny parts that work together. One important part is called the CPU, which is like the computer's brain. It helps the computer think and solve problems. Computers also have memory, like our brains, where they store information to use later.

We can use computers to play games and watch videos. There are also programs on computers that help us write stories and draw pictures. Some computers can even connect to the internet, where we can find more information and talk to people far away.

It's important to take care of our computers. We should keep them clean and not spill water on them. We should also be careful not to drop them or hit them too hard. With proper care, computers can help us do many wonderful things every day.
