

TEXT STRUCTURE: SEQUENCING

Read the given passage and complete the sequence to answer the question.

The water cycle is a magical journey that water takes around our Earth, keeping everything wonderfully connected. It begins when the warm rays of the sun touch oceans, rivers, and lakes, turning water into tiny, invisible water vapors through a process called evaporation. These vapors rise up into the sky and join together to form clouds in a magical dance called condensation. When the clouds become heavy, they release water droplets as rain or snow—a process we call precipitation. This magical rainfall replenishes our lakes, rivers, and oceans, ensuring a continuous and essential cycle that sustains life on our amazing planet.

Write about water cycle in your own words.
